

PC PAL software components

Bringing a scientific dimension to medical systems

Unexploited electronic medical systems

The electronic medical systems bring significant value to institutions in particular for patient management and care pathway monitoring. They aggregate information from different services facilitating tasks such as reporting and planning. But very few solutions offer a true scientific value to physicians in their specialties.

The consequence is a low use and adoption rate of software solutions by the physician community.

Increase medical systems usage and adoption rates

Our long experience and success in the implementation of decision support solutions in medical systems are our strength. We develop and sell first class software components which help doctors interpret medical data within their areas of expertise.

Designed with the best technologies, our software components allow a fast and easy interaction with complex data, which greatly facilitate decision making. This approach has the advantage of an increased attractiveness of medical information systems.

The added value of our components is based on a broad scientific library designed and updated with our academic partners covering over fortyfive countries.

Medical software components designed for integration

Our medical specialty software components are specifically designed to be integrated into hospital medical systems. The richness of their interfaces and their various implementation formats allows seamless integration into your systems.

This approach preserves the spirit of your systems.

PC PAL specialty components are available for the following environments:

- Components for web applications
- Components for Windows applications
- Smart Client Architecture
- Web Services

Tailored consulting services for successful implementation

Our support services help ensure successful implementations ensuring the adoption of the system by users including its integrity and security.

Our expertise in implementing many systems in various architectures is available to our partners through training sessions and skills transfer:

- Implementation workshops
- Components architecture and APIs training sessions
- Project monitoring and implementation follow up

Ad-hoc business models

Whatever business model is considered, our business approach is flexible to best meet your expectations.

- OEM
- Distribution agreements
- White mark
